

662 and 664, because, in the preferred mode of operation, it is only in these two incubators where fluids are dispensed into MTUs 160 while they are in the incubator.

Two temperature sensors 666, preferably thermistors (10 KOhm at 25° C), are positioned in the top plate 642. YSI 44036 series thermistors available from YSI, Inc. of Yellow Springs, Ohio are preferred. YSI thermistors are preferred because of their high accuracy and the $\pm 0.1^{\circ}\text{C}$ interchangeability provided by YSI thermistors from one thermistor to another. One of the sensors 666 is for primary temperature control, that is, it sends singles to the embedded controller for controlling temperature within the incubator, and the other sensor is for monitoring temperature of the incubator as a back-up check of the primary temperature control sensor. The embedded controller monitors the sensors 666 and controls the heating foils 660 and fan 632 to maintain a uniform, desired temperature within the incubator housing 610.

As a transport mechanism 500, 502 prepares to load an MTU 160 into an incubator 600, 602, 604, or 606, the motor 640 turns the hub 646 to bring an empty MTU station 676 into alignment with the receptacle access opening 614 (or 616). As this occurs, the door-actuating solenoid correspondingly turns the revolving door 622 (or 624) one-quarter turn to align the MTU slot 626 of the door with the MTU station 676. The access opening 614 is thus exposed to allow placement or removal of an MTU 160. The transport mechanism 500 or 502 then advances the distributor hook 506 from the retracted position to the extended position, pushing the MTU 160 out of the housing 504, through the access opening 614, and into an MTU station 676 in the incubator. After the distributor hook 506 is withdrawn, the motor 640 turns the hub 646, shifting the previously inserted MTU 160 away from the access opening 614, and the revolving door 622 closes once again. This sequence is repeated for subsequent MTUs inserted into the rotary incubator. Incubation of each loaded MTU continues as that MTU advances around the incubator (counter-clockwise) towards the exit slot 618.

An MTU sensor (preferably an infrared optical reflective sensor) in each of the MTU stations 676 detects the presence of an MTU 160 within the station. Optek Technology, Inc. sensors, model number OPB770T, available from Optek Technology, Inc. of Carrollton, Texas are preferred because of the ability of these sensors to withstand the high temperature environment of the incubators and because of the ability of these sensors to read bar code data fixed to the label-receiving surfaces 175 of the label-receiving structures 174 of the MTUs 160. In addition, each door assembly (revolving doors 622, 624) preferably includes slotted optical sensors (not shown) to indicate door open and door closed positions. Sensors available from

Optek Technology, Inc. of Carrollton, Texas, model number OPB980T11, are preferred because of the relatively fine resolution provided thereby to permit accurate monitoring of door position. A skewed disk linear mixer (also known as a wobblers plate) 634 is provided within housing 610 adjacent MTU carousel assembly 671 and operates as a receptacle mixing mechanism. The mixer 634 comprises a disk mounted in a skewed manner to the shaft of a motor 636 which extends through opening 635 into the housing 610. The motor is preferably a VEXTA stepper motor, model number PK264-01A, available from Oriental Motors Ltd. of Tokyo, Japan, which is the same motor preferably used for the MTU carousel assembly 671. A viscous harmonic damper 638 is preferably attached to motor 636 to damp out harmonic frequencies of the motor which can cause the motor to stall. Preferred harmonic dampers are VEXTA harmonic dampers, available from Oriental Motors Ltd. The operation of the skewed disk linear mixer 634 will be described below.

Only two of the incubators, the amplification incubator 604 and the hybridization protection assay incubator 606, include a skewed disk linear mixer 634, because, in the preferred mode of operation, it is only in these two incubators where fluids are dispensed into the MTUs 160 while they are in the incubator. Thus, it is only necessary to provide linear mixing of the MTU 160 by the skewed disk linear mixer 634 in the amplification incubator 604 and the hybridization protection assay incubator 606.

To effect linear mixing of an MTU 160 in the incubator by linear mixer 634, the MTU carousel assembly 671 moves the MTU 160 into alignment with the skewed disk linear mixer 634, and the skewed disk of the skewed disk linear mixer 634 engages the MTU manipulating structure 166 of the MTU 160. As the motor 636 spins the skewed disk of the skewed disk linear mixer 634, the portion of the skewed disk structure engaged with the MTU 160 moves radially in and out with respect to the wall of the housing 610, thus alternately engaging the vertical piece 167 of the MTU manipulating structure 166 and the shield structure 169. Accordingly, the MTU 160 engaged with the skewed disk linear mixer 634 is moved radially in and out, preferably at high frequency, providing linear mixing of the contents of the MTU 160. For the amplification incubation step of the preferred mode of operation, which occurs within the amplification incubator 604, a mixing frequency of 10 Hz is preferred. For the probe incubation step of the preferred mode of operation, which occurs within the hybridization protection assay incubator 606, a mixing frequency of 14 Hz is preferred. Finally, for the select

incubation step of the preferred mode of operation, which also occurs within the hybridization protection assay incubator 606, a mixing frequency of 13 Hz is preferred.

The raised arcuate portions 171, 172 may be provided in the middle of the convex surfaces of the vertical piece 167 and the shield structure 169 of the MTU 160, respectively, (see FIGURE 60) to minimize the surface contact between the skewed disk linear mixer 634 and the MTU 160 so as to minimize friction between the MTU 160 and the skewed disk linear mixer 634.

In the preferred embodiment, a sensor is provided at the skewed disk linear mixer 634 to ensure that the skewed disk linear mixer 634 stops rotating in the "home" position shown in FIGURE 21, so that MTU manipulating structure 166 can engage and disengage from the skewed disk linear mixer 634 as the MTU carousel assembly 671 rotates. The preferred "home" sensor is a pin extending laterally from the skewed disk linear mixer structure and a slotted optical switch which verifies orientation of the skewed disk linear mixer assembly when the pin interrupts the optical switch beam. Hall effect sensors based on magnetism may also be used.

An alternate MTU carousel assembly and carousel drive mechanism are shown in FIGURES 23A and 23C. As shown in FIGURE 23A, the alternate incubator includes a housing assembly 1650 generally comprising a cylindrical portion 1610 constructed of nickel-plated cast aluminum, a cover 1676 preferably formed of machined aluminum, insulation 1678 for the cover 1676, and an insulation jacket 1651 surrounding the cylindrical portion 1610. As with the previously described incubator embodiment, the incubator may include a linear mixer mechanism including a linear mixer motor 636 with a harmonic damper 638. A closure mechanism 1600 (described below) operates to close off or permit access through a receptacle access opening 1614. As with the previously described embodiment, the incubator may include one or two access openings 1614 depending on the location of the incubator and its function within the analyzer 50.

A centrifugal fan 632 is mounted at a bottom portion of the housing 1650 and is driven by a motor (not shown). A fan cover 1652 is disposed over the fan and includes sufficient openings to permit air flow generated by the fan 632. A carousel support shaft 1654 includes a lower shaft 1692 and an upper shaft 1690 divided by a support disk 1694. The support shaft 1654 is supported by means of the lower shaft 1692 extending down into the fan cover 1652 where it is rotatably supported and secured by bearings (not shown).
